

## MEDICAL REPORT

**NAME: ALEXIS PHINN**  
**MR NO: 802 5493 4122**  
**DOB: 6/3/2010**  
**SEX: MALE**  
**NATIONALITY: Canadian**

Alexis phinn is a thirteen year old male child who was born with dextro-transposition of the great arteries (d-TGA) with ventricular septal defect and left ventricular outflow tract (LVOT) obstruction and needed patent ductus arteriosus (PDA) stenting. Then, at the age of 1½ years, he went for Nikaidoh operation and PDA ligation.

His last clinic visit with me was in May 2017. His mother did not mention any cardiovascular complaints and he was not on any cardiac medicines. His vital signs and cardiovascular examination were normal except for 2/6 to-and-fro murmur at the left midsternal border.

ECG (May 2017): Normal for age except for left ventricular hypertrophy by voltage criteria.

Echocardiography (September 2016): Trivial tricuspid regurgitation, trivial mitral regurgitation, patent RVOT and LVOT with trivial pulmonary regurgitation, and whiff of aortic regurgitation. Good biventricular function. No pericardial effusion.

Plan: Follow-up echocardiography and clinic visit are scheduled. He will need periodic followups in the pediatric cardiology clinic along with ECG and echo tests.

This medical report is written upon his mother's request.

**Dr. Wat Lowthorpe**  
**Sr. Consultant, Pediatric Cardiology**
